ASSIGNMENT-2

TITLE:- Client and Server: Definition with a Real-Life Example

➢ Introduction

The client-server model is a common way computers communicate over a network. In this model, one system requests a service while another system provides it.

- **Client**
  A client is a device or application that requests data or services from another computer. It starts the communication and uses the information it receives.
- **Server**
  A server is a computer or software that receives requests from clients, processes them, and provides the required data or services.
- **Real-Life Example**
  When you use a food delivery app, your mobile phone acts as the client by sending your order request. The company's system acts as the server by processing the order and sending back the confirmation and delivery details.

➢ Conclusion

The client and server work together to make online services smooth and efficient. This model is widely used in websites, mobile apps, email services, and many other digital systems.
