ASSIGNMENT-3

TITLE:- Desktop Apps, Web Apps, and Mobile Apps: Two Unique Differences Each

INTRODUCTION

Modern software is developed for different platforms to match the way people work and communicate. Desktop, web, and mobile applications each have their own strengths and are built for different user experiences.

APPLICATION TYPE	DIFFERENCE 1	DIFFERENCE 2
Desktop Apps	*Usually provide better control over computer hardware, making them suitable for professional software.*	*Performance remains stable even when the internet is unavailable because most processing happens on the local system.*
Web Apps	*Users can continue working on the same account from different devices without transferring files manually.*	*New features and security improvements become available instantly without requiring users to install updates.*
Mobile Apps	*Designed for short, quick interactions, allowing users to complete tasks within a few taps.*	*Can send real-time notifications and use sensors such as GPS, camera, microphone, and accelerometer to provide personalized experiences.*

CONCLUSION

Each type of application is created with a different purpose in mind. Understanding these differences helps developers choose the most suitable platform for building efficient and user-friendly software.
