ASSIGNMENT-5

Title: *Difference Between a Developer and a Tester*

INTRODUCTION

In software development, both developers and testers play important roles in building high-quality applications. Developers create software, while testers ensure that the software works correctly and is free from defects.

Developer	Tester
A developer writes, designs, and maintains the source code of software applications.	*A tester checks the software to find bugs, errors, and ensure it meets the required quality standards.*
A developer focuses on creating new features and functionality.	*A tester focuses on verifying that the software works correctly and provides a good user experience.*

Conclusion

Developers and testers work together to deliver reliable and high-quality software. While developers build the application, testers ensure it is error-free, functional, and ready for users.
